Tuberculosis Screening and Treatment

What is Tuberculosis:

Tuberculosis ("TB") is a serious, infectious (transmitted through the air) disease that most commonly affects the lungs. In the lungs, the bacteria destroys elastic lung tissues and is replaced with fibrous connective tissues. The general symptoms of active TB are often subtle, unnoticeable and may include: Fatigue; Weight Loss; Fever; Chills; and Night Sweats. Symptoms of TB in the lungs may include: a persistent cough; chest pain; and coughing up blood. Although TB is preventable and can be cured with proper medication, 5% to 10% of those with active TB will die from the disease. This is usually due to patients not taking their medications correctly or improper drug treatment. TB is usually diagnosed through the use of the Mantoux tuberculin skin test. In this test, a dose of purified protein derived from the Tubercle bacilli, which is non-infectious, is injected into the upper layer of skin on the inside of the forearm. Forty-eight to 72 hours after the injection, the test site is examined. In most cases a hardened area of tissue 10 millimeters or larger is considered an indication of infection with TB, but it is not necessarily an indication of having active TB. Chest x-rays and sputum smears and cultures are used to test for active TB.

There are several high risk groups in the US that are known to have a high rate of TB. They include:

- The homeless;
- IV drug users
- Alcoholics;
- Prison inmates
- The elderly;
- Persons with HIV infections/AIDS

Screening:

Upon consent, all new inmates who are processed into jail, without written proof of receiving TB testing in the past year, will receive purified protein derivative (PPD) during the health screening. A nurse will read the PPD forty-eight (48) to seventy-two (72) hours afterwards and document the results in the patient's medical file. The patient will be instructed during the health screening to the necessity of follow-up medical care, the results (both positive or negative) and treatment which may be necessary.

Treatment:

During the screening, if a patient states he/she is past positive, we will not plant PPD, but will obtain a chest x-ray to see if the tuberculosis is active. When a nurse reads a positive PPD, a chest x-ray will be ordered as per physician protocol. The patient will receive information regarding the test results, symptoms of TB, proposed treatment, and follow-up care, etc.

Should the chest x-ray suggest active TB, the local Health Department, SHP Medical Team Administrator, and SHP corporate office should be notified immediately. Initiating therapy/treatment should begin under the recommendations of the local Health Department and in conjunction with the jail physician. The jail will immediately segregate the patient from general population. All people who have come in contact with the patient will have a skin test. The patient will have restricted movement and visitors in the jail, and will be required to wear a mask at all times during contact with staff and/or other persons, until subsequent tests prove no longer infectious.

All new inmates who are processed into the jail, who are on treatment and deemed not infectious will be housed in general population. If a patient is released from Jail during therapy, the local Health Department will be notified and provided with the patient's release location and/or the patient's last known address.

Consent for Testing/Treatment:

I hereby give my consent for TB testing and/or treatment, if needed. I have read and understand the above information regarding testing and treatment procedures.

AUTHORIZATION FOR RELEASE OF MEDICAL INFORMATION TO CORRECTIONAL FACILITY

To: ARH

I hereby authorize any hospital, clinic, physician's office, and/or health agency to provide any information they may have acquired while attending me for a medical, dental, or psychiatric problem to Southern Health Partners, Inc. who is the medical care provider of this Correctional Facility. Such information may include the following items:

Summary of positive findings, most recent history, physical exam including any laboratory tests, Medical/dental/psychiatric/psychological diagnosis and treatment regimen when last treated, Hospital discharge summary for any/all hospitalization(s), Laboratory and/or x-ray study report, any other medical/dental/psychiatric services I may have previously had, and all other records and treatment plans. Other Records: X - Keys

I understand my records are protected under state and/or federal privacy laws, and cannot be released to any other outside party without my written consent unless otherwise provided for by state or federal law. All information received will be kept within the patient's medical file within the correctional medical unit and will not be used for any other provision of health care services.

I release responsibility and/or liability from the correctional facility for the release of the above indicated medical information to the medical unit to the extent indicated and authorized.

Tuberculosis Screening and Treatment

What is Tuberculosis:

Tuberculosis ("TB") is a serious, infectious (transmitted through the air) disease that most commonly affects the lungs. In the lungs, the bacteria destroys elastic lung tissues and is replaced with fibrous connective tissues. The general symptoms of active TB are often subtle, unnoticeable and may include: Fatigue; Weight Loss; Fever; Chills; and Night Sweats. Symptoms of TB in the lungs may include: a persistent cough; chest pain; and coughing up blood. Although TB is preventable and can be cured with proper medication, 5% to 10% of those with active TB will die from the disease. This is usually due to patients not taking their medications correctly or improper drug treatment. TB is usually diagnosed through the use of the Mantoux tuberculin skin test. In this test, a dose of purified protein derivative from the Tubercle bacilli, which is non-infectious, is injected into the upper layer of skin on the inside of the forearm. Forty-eight to 72 hours after the injection, the test site is examined. In most cases a hardened area of tissue 10 millimeters or larger is considered an indication of infection with TB, but it is not necessarily an indication of having active TB. Chest x-rays and sputum smears and cultures are used to test for active TB.

There are several high risk groups in the US that are known to have a high rate of TB. They include:

- The homeless;
- IV drug users
- Alcoholics;
- Prison inmates
- The elderly;
- Persons with HIV infections/AIDS

Screening:

Upon consent, all new inmates who are processed into jail, without written proof of receiving TB testing in the past year, will receive purified protein derivative (PPD) during the health screening. A nurse will read the PPD forty-eight (48) to seventy-two (72) hours afterwards and document the results in the patient's medical file. The patient will be instructed during the health screening to the necessity of follow-up medical care, the results (both positive or negative) and treatment which may be necessary.

Treatment:

During the screening, if a patient states he/she is past positive, we will not plant PPD, but will obtain a chest x-ray to see if the tuberculosis is active. When a nurse reads a positive PPD, a chest x-ray will be ordered as per physician protocol. The patient will receive information regarding the test results, symptoms of TB, proposed treatment, and follow-up care, etc.

Should the chest x-ray suggest active TB, the local Health Department, SHP Medical Team Administrator, and SHP corporate office should be notified immediately. Initiating therapy/treatment should begin under the recommendations of the local Health Department and in conjunction with the jail physician. The jail will immediately segregate the patient from general population. All people who have come in contact with the patient will have a skin test. The patient will have restricted movement and visitors in the jail, and will be required to wear a mask at all times during contact with staff and/or other persons, until subsequent tests prove no longer infectious.

All new inmates who are processed into the jail, who are on treatment and deemed not infectious will be housed in general population. If a patient is released from Jail during therapy, the local Health Department will be notified and provided with the patient's release location and/or the patient's last known address.

Consent for Testing/Treatment:

I hereby give my consent for TB testing and/or treatment, if needed. I have read and understand the above information regarding testing and treatment procedures.
